## Dynamics of Masses

subject to Counter
moving Flows
J. West

ISU, Dept. of Chemistry \& Physics
M. Syed

RHIT, Physics \& Optical Engineering

## Motivation (and Cost)

- Programming, Modeling and Numerical Methods are necessary skills
- A Challenging Project is Rewarding and a Portfolio Point
- Options:
- Stand-Alone Course
- Grafted onto a Physics course
- They all COST TIME!! But it IS worth the price

# Current Approach at ISU and RHIT 

- Indiana State University
- Students take the introductory course for CS majors
- Math Methods course (using some Mathematica)
- PH 310 is required, Sophomore or Junior year (alternates years)
- Rose-Hulman Institute of Technology
- One introductory programming course (CS 120 or ME 123)
- One course (EP 280/380, not required, offers some Comsol)
- Mechanics currently uses Excel (at an advanced level)
- Vpython $\rightarrow$ Symbolic is easier, Chosen on

Purpose

## Mechanics Brings Goals Together

The mid-level Mechanics course is an optimal time and environment for programming exposure(Caballero and Pollock (AJP 82 p. 231)

| Advanced | $\bullet$ Conservation <br> principles |
| :---: | :---: |
| Physics Concepts |  |
| •Advanced dynamics |  |
| $\bullet$ Variable mass |  |$|$

## Why Changing Mass

- Changing mass is a challenging/important topic in every Mechanics Textbook
- The timing with stages works well
- Infinitesimal reasoning is a topic with variety and challenge for students (Korff and Rebello, AJP 82, p. 695).
- Many variations on a basic model, some providing (NEW) analytic solutions, suitable for numerical work
- A student MAY choose their own project, pending Instructor Approval

## Project Requirements

- Learn the basics of the language and graphics library via "stages"
- Last Stage: Upgrade to Improved Euler Method
- Mass Accretion Computation Plan (dM, M, scale color effects) must be submitted
- Present results and the program to "the class experts" (Know your audience !!)
- Submit a Final Paper as if submitting to AJP
- Compare Numerical Results with Analytical Results
- Compare "fitted" data to analytic expressions
- GRAPHS!!!!

## Assessment

- The project represents $25 \%$ of the total grade
- Graphics components are necessary, beauty is voted for and gets bonus points. PHYSICS FIRST!!

| Project Score |  |
| :--- | :--- |
| Programming and Documentation | $5 \%$ |
| Stage Scores (Timeline is KEY) | $25 \%$ |
| Mass Accretion Computation Plan | $\mathbf{1 0} \%$ |
| Progress Reports (Random) | $\mathbf{1 0} \%$ |
| Final Paper | $30 \%$ |
| Presentation | $\mathbf{2 0} \%$ |

## Implementation Plan

- Analytic solutions will be submitted for publication (AJP? PRE?) in Fall 2014, with concurrent posting to Arxiv
- Project assigned in PH310 at ISU, Spring 2015
- Project will be an Independent Study or assigned in PH 315 at RHIT, Spring 2015
- Student Project assessment will be included in the Course Evaluation process at ISU in Spring 2015 with results shared at a future conference/in AJP

## Possible Configurations

- Falling raindrops and icicles as examples.
- A) Three shapes with sticky mist
- B) One shape + sticky mist + Three Mist Velocities
- C) Prism with Three collision types
- Students take cases in pairs, but work is independent (Debug by Output)
- Shapes:
- Mist velocities: Floating
- Collision Types: Inelastic Prism

Disc
V > v
Catch

Sphere
V < v
Elastic

## Cases with Analytic Solution

| Sticky |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | M(x) | $\mathrm{M}(\mathrm{t})$ | $\mathrm{V}(\mathrm{x})$ | $\mathrm{V}(\mathrm{t})$ | X(t) |
| Static | All | All* | All ${ }^{* *}$ | All | All |
| $\mathrm{V}<\mathrm{v}$ | All* | All | All ${ }^{*}$ | All | All |
| $\mathrm{V}>\mathrm{v}$ | All | P | All | P | None |
| Fall | All | P, S | D | All | P, S |

Catch
$X(t) \quad V(x) \quad V(t)$
Static Yes Yes** Yes
$\mathrm{V}<\mathrm{v}$ Yes Yes Yes
$\mathrm{V}>\mathrm{v}$ No Yes No

* Can get from $\mathrm{M}(\mathrm{t})$ and $\mathrm{X}(\mathrm{t})$ or $\mathrm{V}(\mathrm{x})$
** Can get from $V(t), X(t)$

Elastic
$\mathrm{X}(\mathrm{t}) \quad \mathrm{V}(\mathrm{x}) \quad \mathrm{V}(\mathrm{t})$
Static Yes Yes** Yes
$\mathrm{V}<\mathrm{v}$ Yes Yes** Yes
V>v No No Yes
